ABSTRACT: In 2004, Autoimmunity Research Foundation was founded with the purpose of studying a promising treatment for sarcoidosis and several other chronic inflammatory diseases known as the Marshall Protocol. Patients on the Marshall Protocol work with a prescribing physician to take pulsed doses of antibiotics and regular doses of omalseratan, a medication which activates the immune response. Many, though certainly not all, patients report their progress at MarshallProtocol.com, an online forum which compliments rather than supersedes regular visits to the doctor. Thanks to the Foundation’s advisory resource, Knowledge Base, located at mpkb.org, doctors are able to ensure their patients have clear expectations about the treatment. Further, patients have reported that the online forums offer them a chance to compare their symptoms to others and to gain emotional support, which increases adherence to treatment guidelines. This site is useful to doctors themselves, who review self-reported case histories, ask medical questions of one another in doctors-only forums, and monitor their patients. Another group served by the MP site are those of us associated with the Foundation intent upon further developing the Protocol. Feedback from patients has allowed us to conclude that the immunopathological reaction among autoimmune patients administered this treatment is near universal. Also, web-based feedback has allowed us to fine tune ambiguous treatment instructions for patients, many of whom suffer from cognitive dysfunction. Among web-based forums for patients to report on treatment progress, MarshallProtocol.com is not alone. If subject pool contamination bias is not a consideration, online forums offer a novel and useful way to improve upon a therapeutic approach.
